                                                                                                                                                                                                                                                                                                                                                                                                 Oncogene 22:291-297(2003).

-!- FUNCTION: May play a critical role in death receptor-induced apoptosis and may target CASP8 and CASP10 to the nucleus. May regulate degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3.

-!- SUBCNIT: Interacts with CASP8, CASP10 and GTF3C3. Homodimerizes and heterodimerizes with DEDD.

-I- SUBCELIULAR LOCATION: Nuclear, accumulated in subnuclear structures resembling nucleoii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               INTERACTIONS WITH CASP8 AND CASP10.

```

ISOId-08WXF8-2; Sequence=VSP 010312;
TISSUE SPECIFICITY: Expressed in most tissues. High levels were found in liver, kidney, heart, ovary, spleen, testes, skeletal muscle and peripheral blood leukocytes. Expression was absent or low in colon and small intestine. Expression is relatively high the tumor cell lines chronic myologenous leukemia K-562 and the colorectal adenocarcinoma SW480. Expression is moderate in the cervical carcinoma HeLa, the Burkitt's lymphoma Raj, the lung carcinoma A549, and the melonoma G361. In contrast, two leukemia cell lines, HI-60 (promyelocytic leukemia) and MOLT-4

Notifice May play a critical role in death receptor-induced apoptosis and may target CASP8 and CASP10 to the nucleus. May regulate degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3.

SUBUNIT: Interacts with CASP8, CASP10 and GTF3C3. Homodimerizes and heterodimerizes with DEDD (By similarity).

SUBCELLULAR LOCATION: Nuclear, accumulated in subnuclear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    domain (By similarity).
SIMILARITY: Contains 1 death effector (DED)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Expression is high in liver, heart, and testis but low in brain, spleen, lung, and skeleton DOMAIN: Interactions with CASP8 and CASP10 are mediated

SUBCELLULAR LOCATION: Cytoplasmic. Translocated to the nucleus during CD95-mediated apoptosis where it is localized in the nucleoli. Following apoptosis induction, the mono and/or diubiquitination form increases and forms filamentous structure that colocalize with KRTB and KRTB intermediate filament netwin simple epithelial cells (By similarity).

TISSUE SPECIFICITY: Ubiquitously expressed.

PTM: Exists predominantly in a mono- or diubiquitinated form.

SIMILARITY: Contains 1 death effector (DED) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: A scaffold protein that directs CASP3 to certain substrates and facilitates their ordered degradation during apoptosis. May also play a role in mediating CASP3 cleavage of KRT18. Regulates degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3 (By similarity) Inhibits DNA transcription in vitro. SUBUNIT: Interacts with CASP8, CASP10, KRT8, KRT18, CASP3 and FADD. Homodimerizes and heterodimerizes with DEDD2 (By

Endocrinology 139:4839-4848(1998).
-!- FUNCTION: A scaffold protein that directs CASP3 to certain substrates and facilitates their ordered degradation during apoptosis. May also play a role in mediating CASP3 cleavage of KRT18. Regulates degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3. Inhibits DNA transcription in vitro (By similarity).
-!- SUBUNIT: Interacts with CASP8, CASP10, KRT8, KRT18, CASP3 and FADD. Homodimerizes and heterodimerizes with DEDD2 (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NCBI_TaxID=10116;
                                                                                                                                                                                                                                                  similarity).

SUBCELLULAR LOCATION: Cytoplasmic. Translocated to the nucleus during CD95-mediated apoptosis where it is localized in the nucleoli Following apoptosis induction, the mono and/or diubiquitination form increases and forms filamentous structures that colocalize with KRT8 and KRT18 intermediate filament network in simple epithelial cells (By similarity).

TISSUE SPECIFICITY: Widely expressed with highest levels in testis. Within the testis, highly expressed in Sertoli cells.

DEVELOPMENTAL STAGE: First detected in 20-day-old animals. Reaches a near at 20 day.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        192
